

# Robot “Brain”

SS-3406 Introduction to Robotics

# RECAP

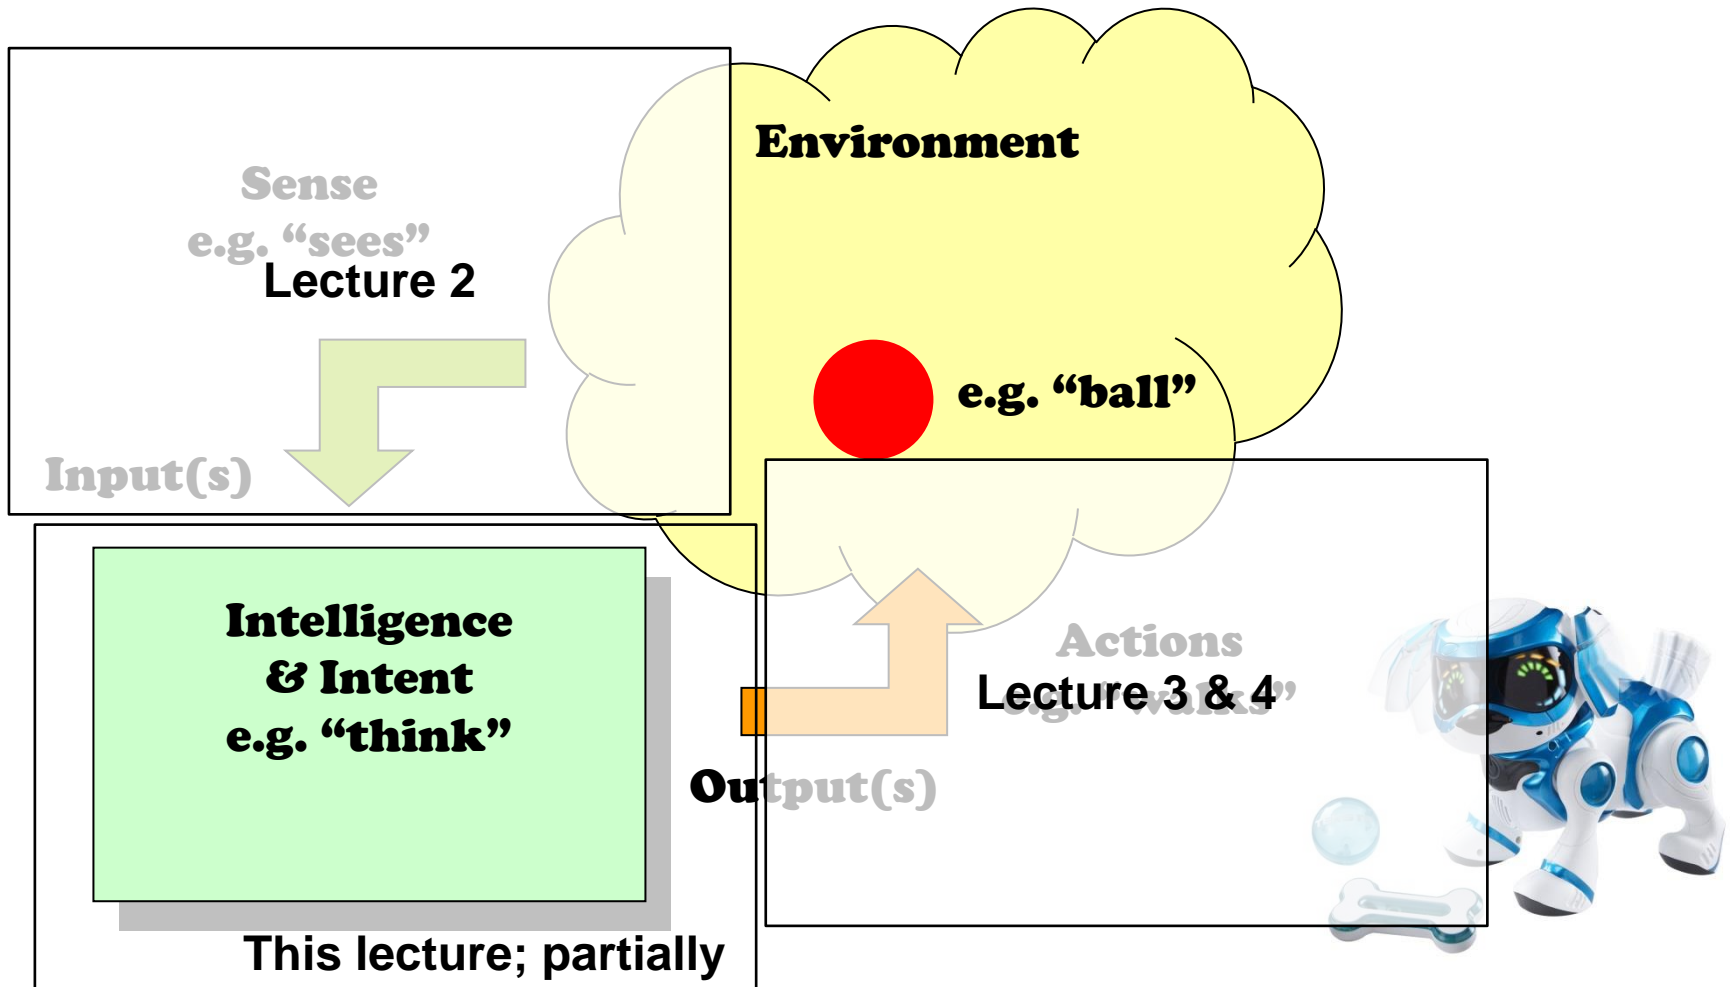

# Summary of Prev Lecture

- We were looking at the robot actions.
- Recall that we had looked into robot sensing in earlier lectures.
- We discussed robot actions in two main sub-topics:
  - The hardware involved: actuators and effectors.
  - The actions: locomotion and manipulation.
  - In both types of actions, they involve movement or motion.
- We looked at a few concepts in robot motion:
  - Degree of freedom, Holonomic
  - Kinematic, Dynamics, Trajectory
- On locomotion:
  - Gait, stability
  - We are preferring wheels
- On manipulation:
  - Forward and inverse kinematics
  - We shy away from the dynamics

# Today's Menu

- On the robot “brain”
- Microcontrollers
- Robot control concepts
- Robot programming: intro

# Properties of a Robot

# Two Components of Intelligence

- Learn
  - Gain new knowledge and skills.
- Think
  - Use existing knowledge and skills.
  - E.g. sense, plan, act.
- Today: only the “thinking” part.
  - What does the sensor data mean?
  - What does the current state mean?
  - What should I do now?

# Two Components of Intelligence

- Learn
  - Gain new knowledge and skills.
- Think
  - Use existing knowledge and skills.
  - E.g. sense, plan, act.
- Today: only the “thinking” part.
  - What does the sensor data mean?
  - What does the current state mean?
  - What should I do now?

# **THE HARDWARE: MICROCONTROLLERS**

# “Brain”: Microcontrollers

- A microcontroller, sometimes called microcontroller unit (MCU), is a **computer** on a single integrated circuit (IC) chip, with features:
  - Incorporate most computer functions in a **single chip**.
  - Access to **input and output** (IOs) is essential.
  - Programmed to perform **specific task(s)**.
  - **Embedded** (hence small) in appliances, toys, devices, vehicles, robots.

# Applications of Microcontrollers

# Microcontrollers for Robots

- Popular:
  - Microchip Technology **PIC** (e.g. PIC16, PIC24, etc)
  - Atmel **AVR** (e.g. Atmega, ATtiny, etc)
  - **ARM** technology (e.g. ARM Cortex-A series)
- What to choose?
  - Accessibility: availability, expertise
  - Price: level of complexity required
  - Characteristics, features
    - Available IOs, devices (e.g. timer)
    - Storage capability
    - Processing speed, energy consumption

# Programming a Microcontroller

- Three things required:
  - Microcontroller
  - Programming Environment (Software)
  - Programmer (Hardware)

# Microcontroller IO Ports

- The inputs and outputs of an MCU are called **port**, and each of them is identified by its **port number** or **pin number**.
  - IOs can be **analog** or **digital**. Digital IOs are easy to use: 1 or 0.
  - An IO **port** often has a number of IO **pins**. In this case, each **port** usually has an **alphabetic** identifier, while each **pin** has an identifier **number**.

**Inputs:** sensors' data, e.g. switches, are fed in through the **input ports/pins**.

**Outputs:** signals to activate the actuators, e.g. turn on a light, are sent out through the **output ports/pins**.

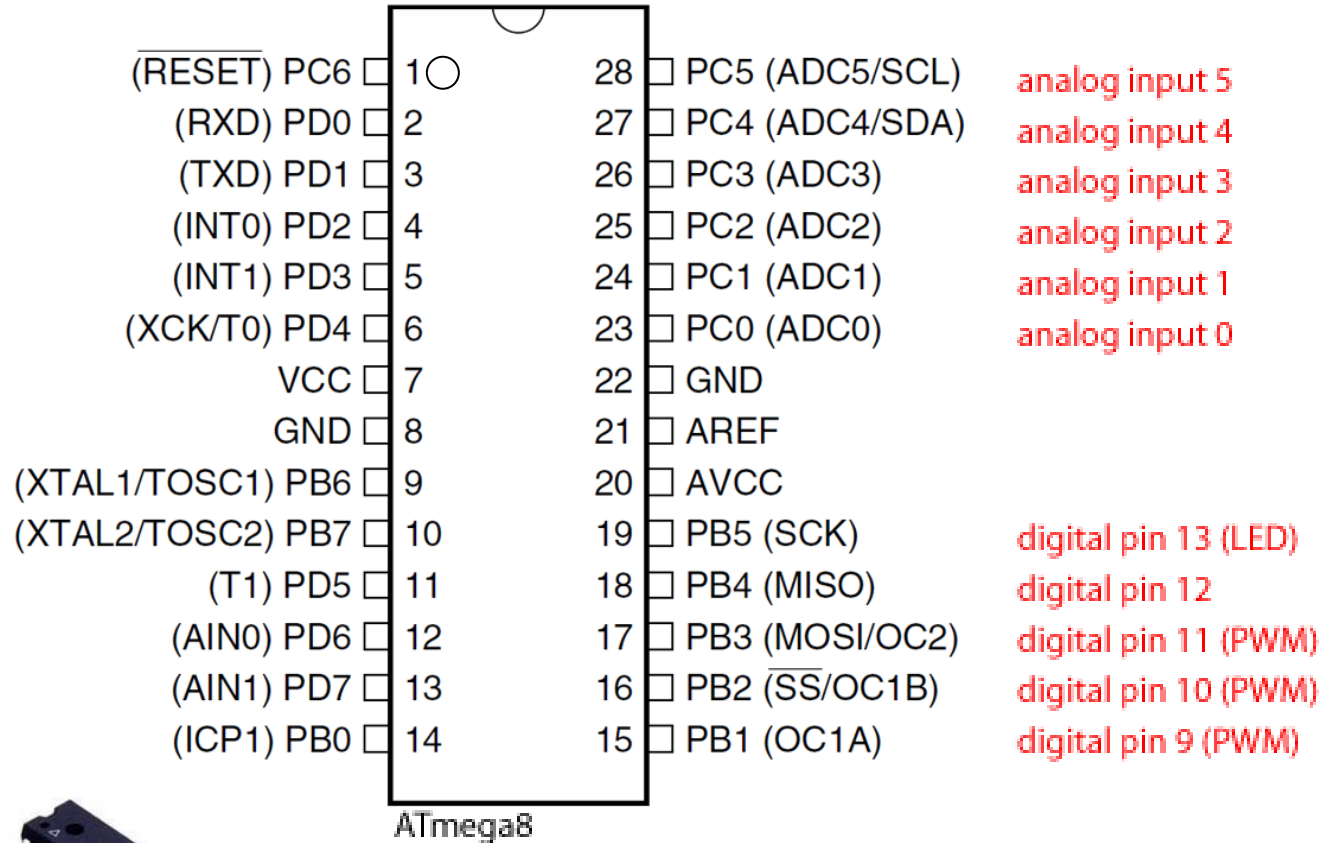

# Atmel ATmega8 Pin Layout

## Arduino Pin Mapping

www.arduino.cc

28 pin DIL IC

digital pin 0 (RX)  
digital pin 1 (TX)  
digital pin 2  
digital pin 3  
digital pin 4

digital pin 5  
digital pin 6  
digital pin 7  
digital pin 8

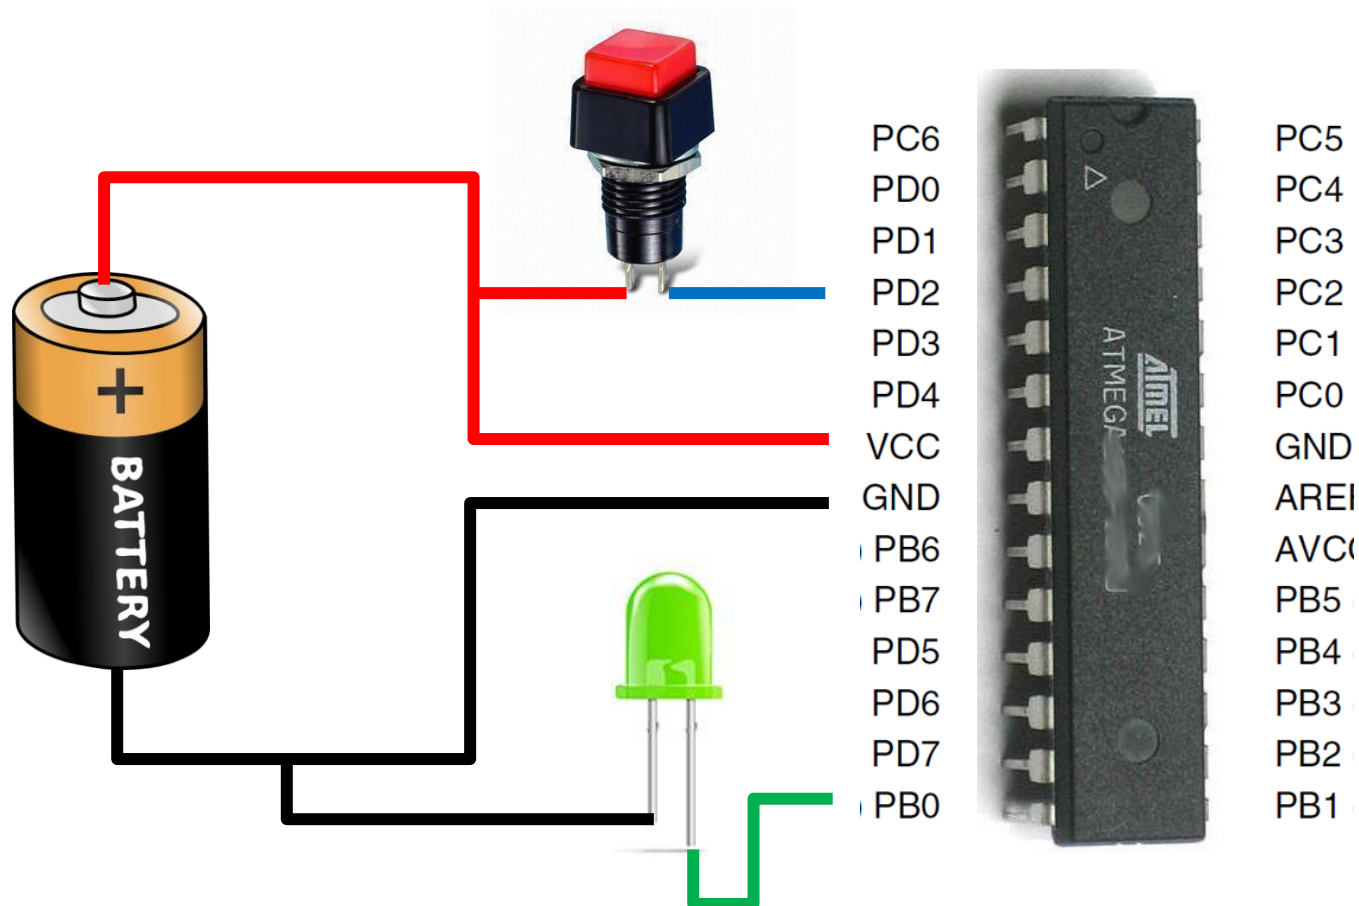

E.g.

PB1 = Pin 1 of Port B; Pin PB1 or B1.

PC4 = Pin 4 of Port C; Pin PC4 or C4.

PD0 = Pin 0 of Port D; Pin PD0 or D0.

# Simple Connection

(Note: This circuit has been simplified. A few more components are required to form a practical circuit.)

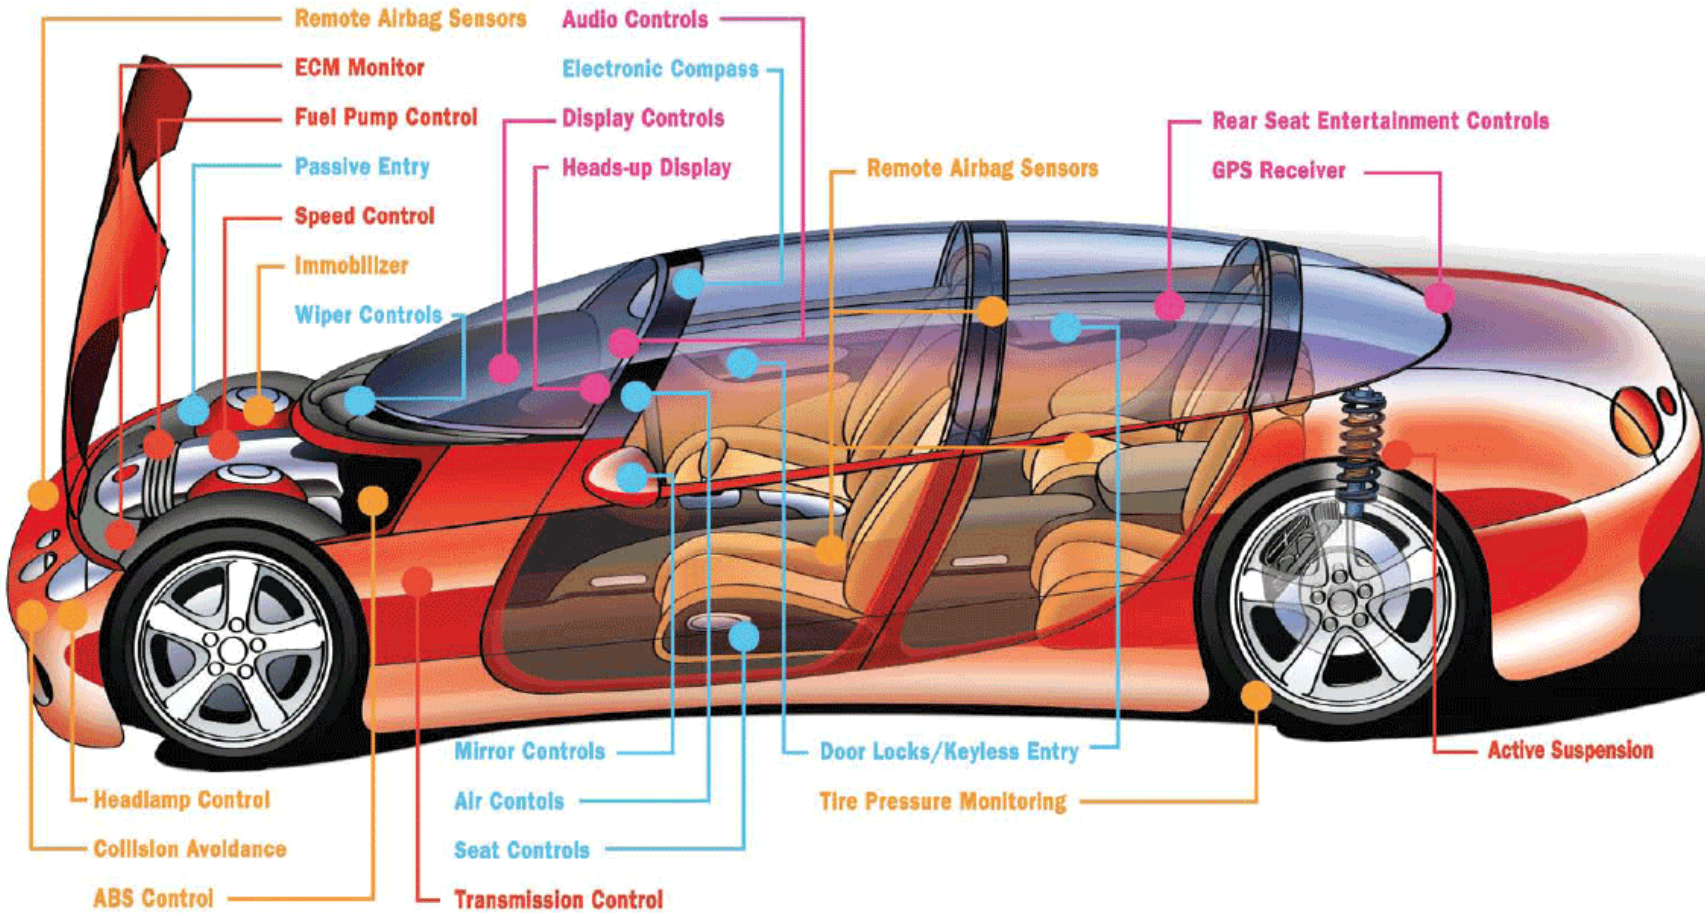

# Microcontroller Boards

- Microcontrollers are often produced on a development board that includes IO and programming circuitry, e.g.
  - BASIC Stamp (PIC-based)
  - Arduino Uno (AVR-based)
  - Arduino Due (ARM-based)

# Many MCUs in One System

Today's vehicles feature many more MCUs, which control numerous functions. (Courtesy of Microchip Technology)

# ROBOT CONTROL CONCEPTS

# Why is Robot Control Hard?

- High-level, complex goals
  - Impossible to “formulate” solution.
  - Chasing the cat versus solving an equation.
- Dynamic (changing) environment
- Robot has dynamic constraints of its own (don't fall over)
- Sensor noise and uncertainty
- Unexpected events (collisions, dropped objects, etc.)

Ref: Coste-Maniere and Simmons (ICRA 2000)

# Robot Control Architectures

- Deliberative (also called hierarchical)
  - Sense-Plan-Act
  - “Top-down” approach: from goals, break into subtasks.
- Reactive
  - Sense-Act
  - May not think.
- Hybrid
  - Deliberative at high level; reactive at low level.
- Behavioral
  - Multiple “hybrid” (or other architectures in above) modules.
  - “Bottom-up” approach: compose high level behaviors from lots of independent low-level behavior modules.

# 1. Deliberative Control

- Think hard, then act: **Sense-Plan-Act** (SPA)
  - All the sensing data tends to be gathered into one global world model (state).
  - Look into the future (plan) before deciding how to act, i.e. evaluate all possible actions to **avoid bad actions**.
  - Take time, i.e. **slow**. Thinking too long can be dangerous, e.g. fall at a cliff.
- Useful in tasks that can take time to plan ahead, e.g. playing chess, determine the route to a destination, when stealing.

## 2. Reactive Control

- Don't think, react: **Sense-Act**.
  - Many animals are largely reactive.
  - Tight couple between sensory inputs and effector outputs.
  - Respond very quickly, i.e. **fast**.
  - Do not look into the past or the future.
  - No ability to learn over time, **cannot deal with complex situations**.
- Use in tasks that require very quick action, e.g. when touched a hot surface, when someone tab your shoulder while you are stealing.

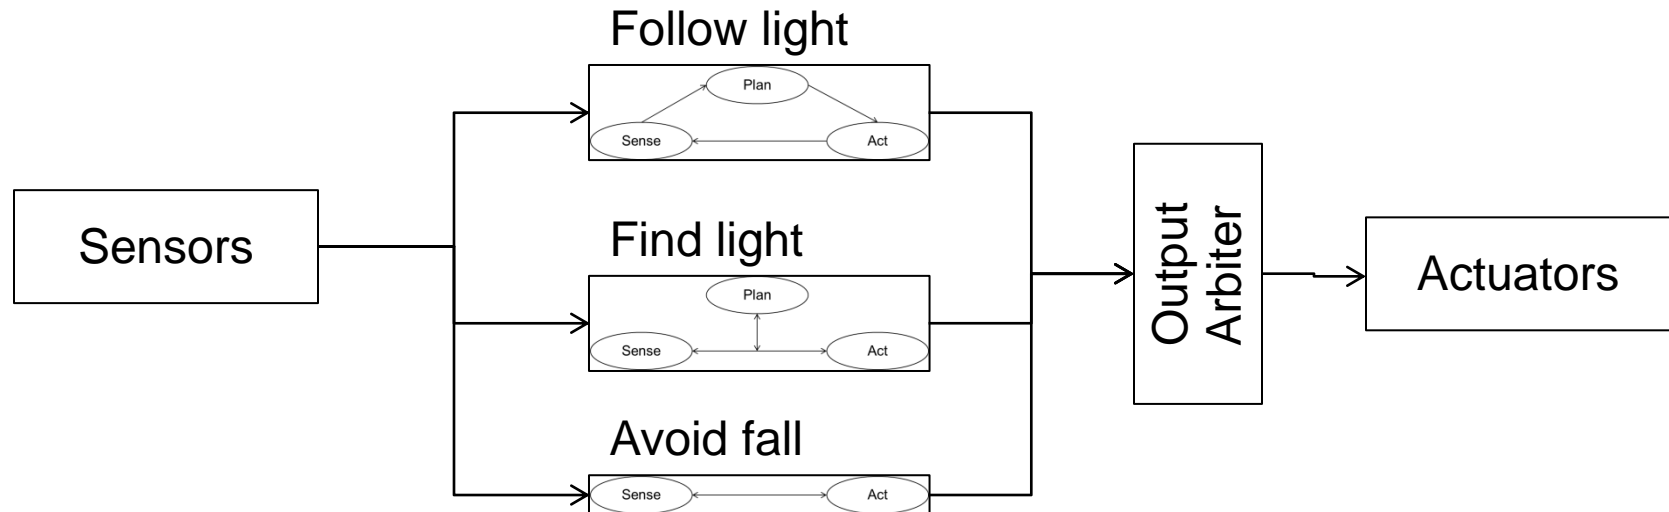

# 3. Hybrid Control

- Think and act independently, in parallel.
  - Combine the best of both Reactive and Deliberative control.
  - **Different parts** of the “brain”: plan some tasks (e.g. the route to distance), while react quickly in some tasks (e.g. avoid fall).
  - Sensors’ data are routed to reactive and deliberative parts of the brain.

# 4. Behavior-based Control

- Overall behavior is composed from a network of primitive behaviors.
  - Examples of primitive behaviors: avoid fall, avoid obstacle, follow light, find light.
- Each behavior module is a control unit based on either deliberative, reactive or hybrid architecture.

# Which control architecture?

- Light chasing robot
  - Moves towards the light source.
  - Light detectors' output drives the wheels.

Implementing the robot control in the MCU ...

# **THE SOFTWARE: ROBOT PROGRAMMING**

# Programming?!

# Program

- A sequence of events to follow.

*Aturcara Majlis*

08:30 am : Ketibaan Tetamu  
09:00 am : Sarapan Pagi  
09:45 am : Para Tetamu Berada Di Ruang Solat Masjid  
10:00 am : Ijab Qabul Akad Nikah  
11:00 am : Walimatulurus Di Ruang Makan Dewan  
01:00 pm : Solat Zohor  
01:30 pm : Ketibaan Pengantin & Resepsi  
02:00 pm : Makan Beradab  
02:30 pm : Potong Kek  
02:45 pm : Sesi Beramas Mesra  
04:00 pm : Majlis Selesai

## Event Programme

- 9.00-9:30 *Arrival and Registration*
- 9:30 Welcome - Councillor Ken Meeson, Leader Solihull MBC
- Health and the Local Economy**  
Melanie Mills, Chief Executive, SEWM  
Meet our CCG Social Value Champions
- 9.45 **Social Value - Outlining the Opportunity**  
Chris White MP for Warwick and Leamington,  
Author of the Public Services (Social Value) Act
- 10:30 **Q & A Panel - Policy in Action**
- 11:00 *Coffee and networking*
- 11:30 **Social Value in Local Authority Procurement**  
Geoff Walker, CEO, Sandwell Community Caring Trust
- 12:00 **Social Value in Health Commissioning**  
Arden CSU and The Young Foundation - Healthy Living Network  
Wendy Lane, Mary Parkes & Sonya Johnson
- 12:30 **Social Value and Public Service Transformation**  
Rashid Bhayat, CEO, Positive Youth Foundation  
Deborah Harrold, CEO, Agewell UK
- 1:00 **Social Value and Evidencing Health Outcomes  
Building Better Health Partnerships**  
Mark Ellerby, Director, Cloudberry  
Suzanne Callen, CEO, Summit House
- 1:30-2:30 **Social Food Fair**  
*Put Your Money Where Your Mouth Is* Campaign
- 2:30-4:00 **Masterclasses**  
*Networking till Close*

Look out  
for details of our  
**Masterclasses**  
- coming  
soon!

# Robot Program

- Remember MCUs are computer?
  - So, a robot program is a computer program
- **Computer program** is a **sequence of instructions** for a computer (MCU) to follow.
  - Note instructions lead to events.

```
task main()
{
    bMotorReflected[port2]=1;
    while(true)
    {
        if(SensorValue(bumper)==0)
        {
            motor[port3]=127;
            motor[port2]=127;
        }

        else
        {
            motor[port3]=127;
            motor[port2]=-127;
            wait1Msec(1500);
        }
    }
}
```

# Programming a Microcontroller

- Three things required:
  - Microcontroller
  - Programming Environment (Software)
  - Programmer (Hardware)

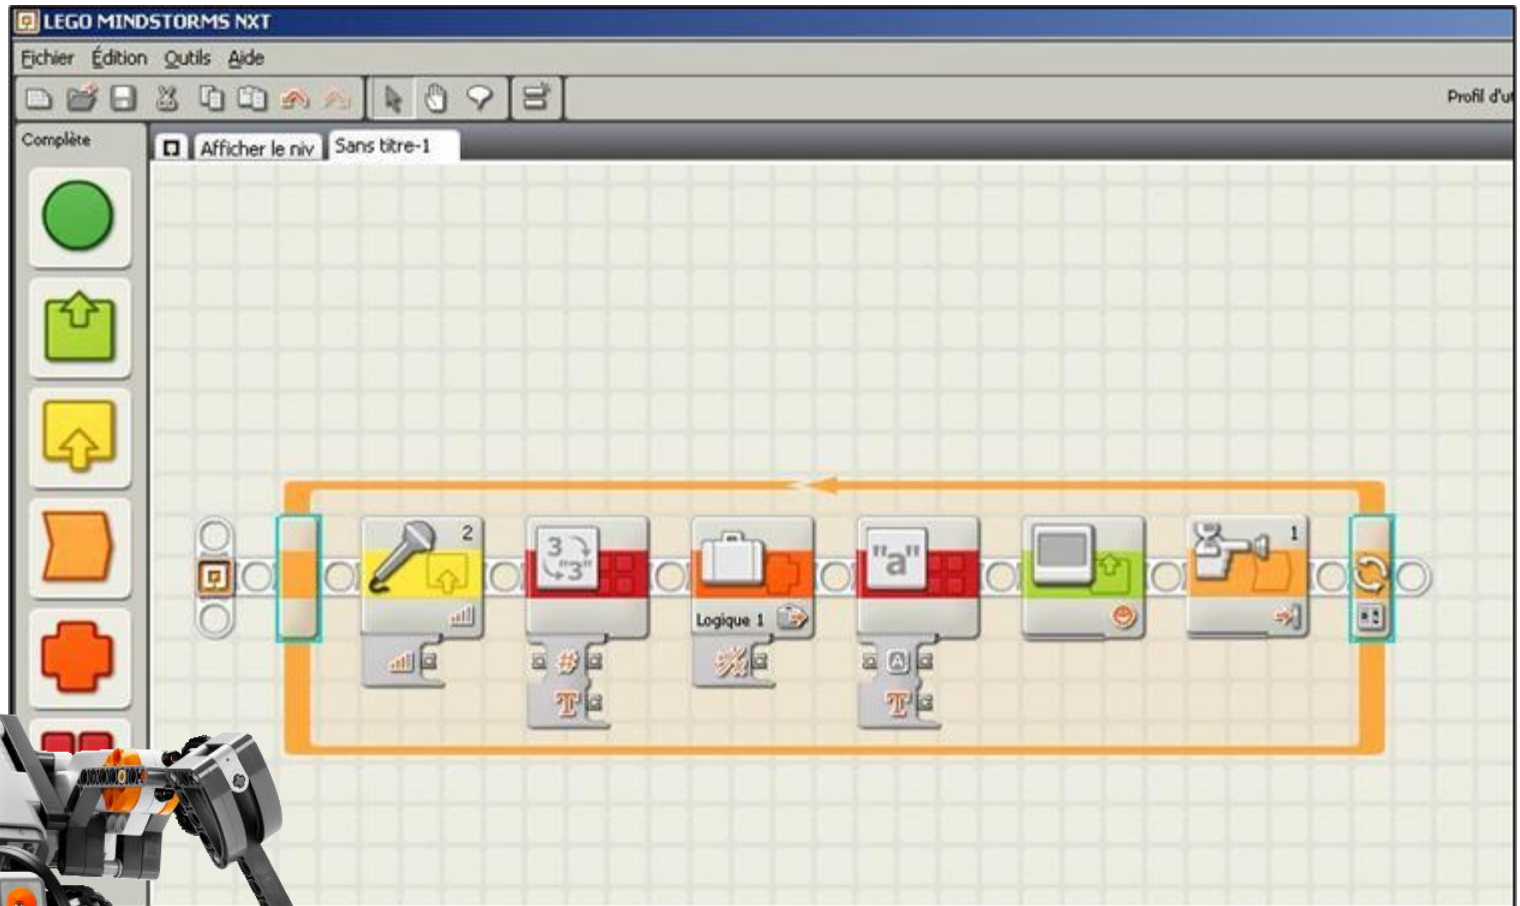

# Programming Environment

- Integrated Development Environment (IDE)
  - Software to write/develop your program.
    - IDE to write program versus MS Word to write letter.
  - Usually has:
    - Source code editor
    - Build automation tools (compiler, download to MCU)
    - Debugger (find errors)
- Two variants:
  - Visual Programming
    - Create the program by moving programming, building blocks, or code nodes to create flowcharts or structure diagrams.
  - Source Code Programming
    - Write instructions in the program based on specific language.

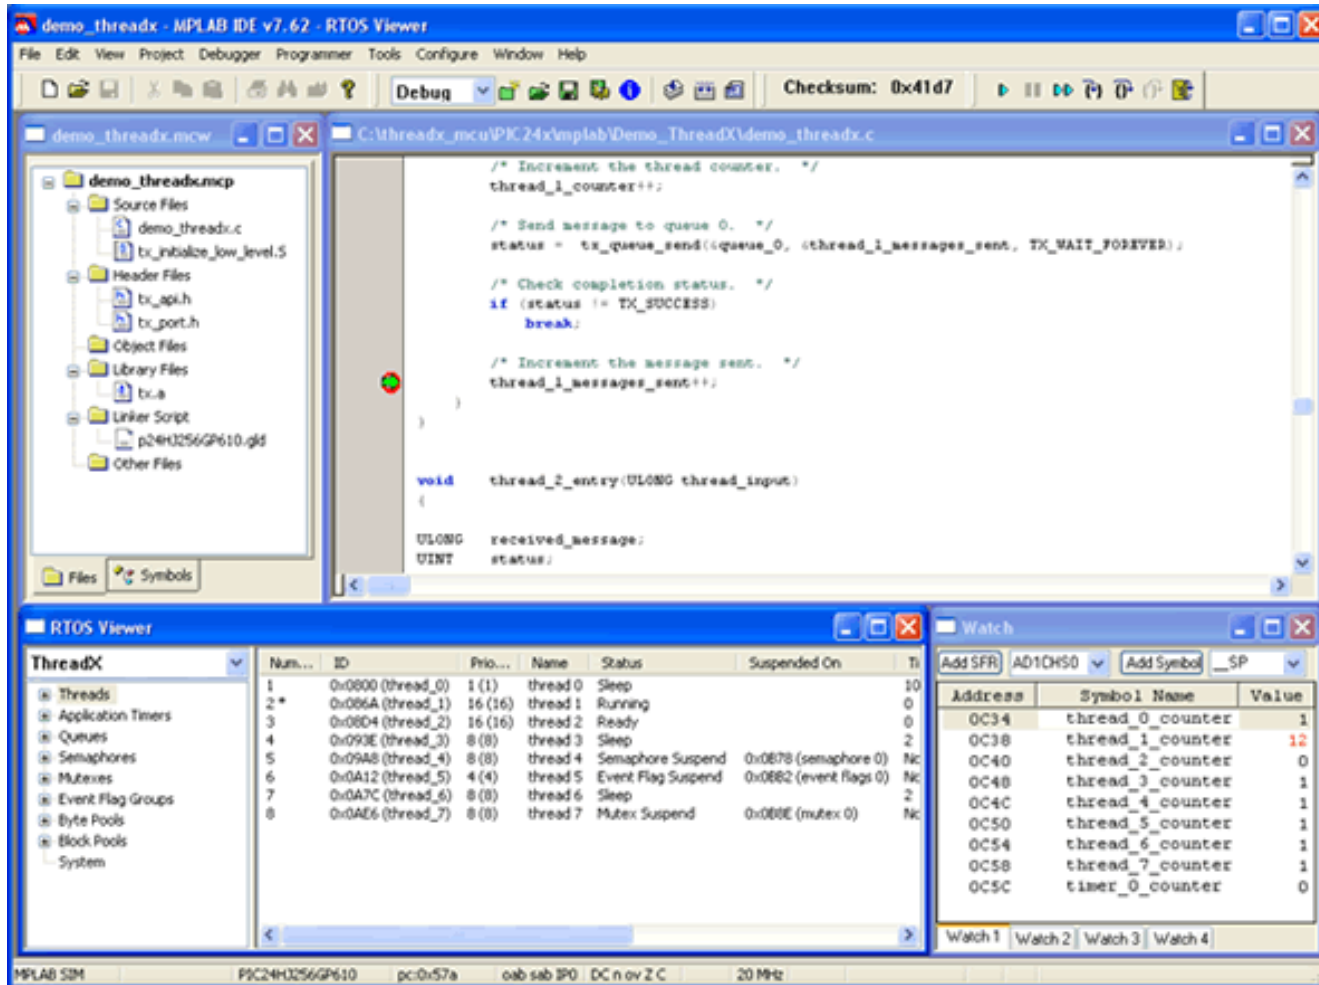

# IDE: Visual Programming

E.g. NXT-G for Lego Mindstorms

# IDE: Source Code Programming

E.g. MPLab for PIC MCUs

# Programming Languages

- Different MCU understand instructions in different languages.
  - Use the correct language to give instructions, i.e. write program, to the MCU.
- Some MCUs have IDE that allow the use of a generic high-level programming language.
  - The “compiler” in the IDE “translate” the generic language into one that the MCU understands.
  - E.g. mikroC PRO for PIC
  - Note: generic high-level programming languages e.g. C, C++, C#, Java, Python.

# Programming in Five Steps

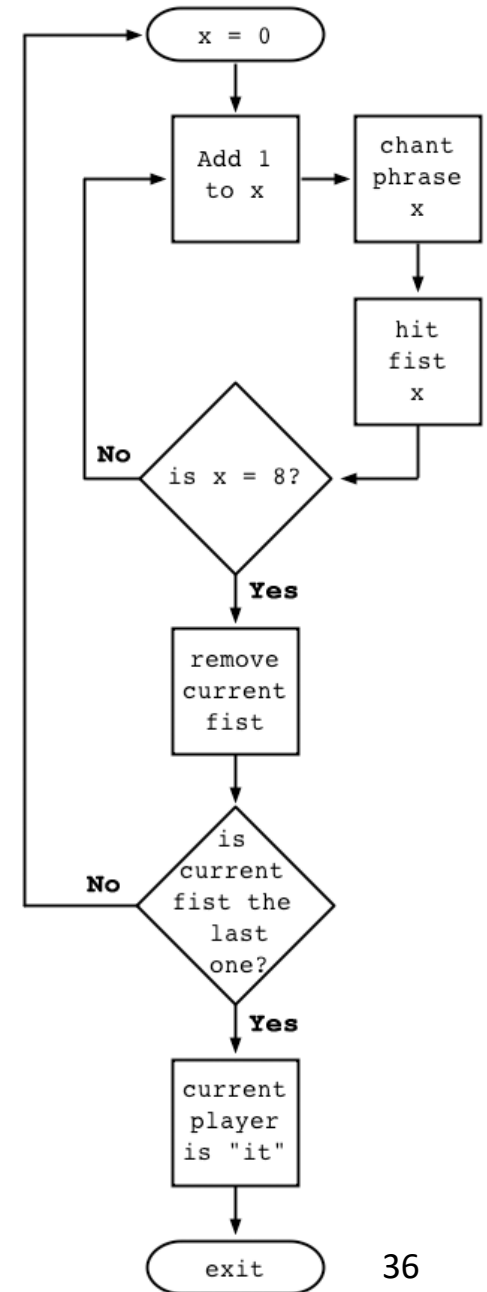

1. What? What exactly do you want to program?
  - E.g. Robot to follow a white line.
2. How? Design the program.
  - Determine program logic (flow).
  - Design details using flowchart and/or pseudocode.
3. Write it. Code the program.
  - Know the language, know the IDE.
4. Test the program. Debugging.
5. Document and maintain.

# Flowchart

- Graphical illustration (diagram) of the program logic, i.e. flow of the sequence of events or instructions.

## The Potato Game

Parameters:  
The chant consists of 8 phrases:  
1- One potato  
2- Two potato  
3- Three potato  
4- Four  
5- Five potato  
6- Six potato  
7- Seven potato  
8- More!

# Pseudocode

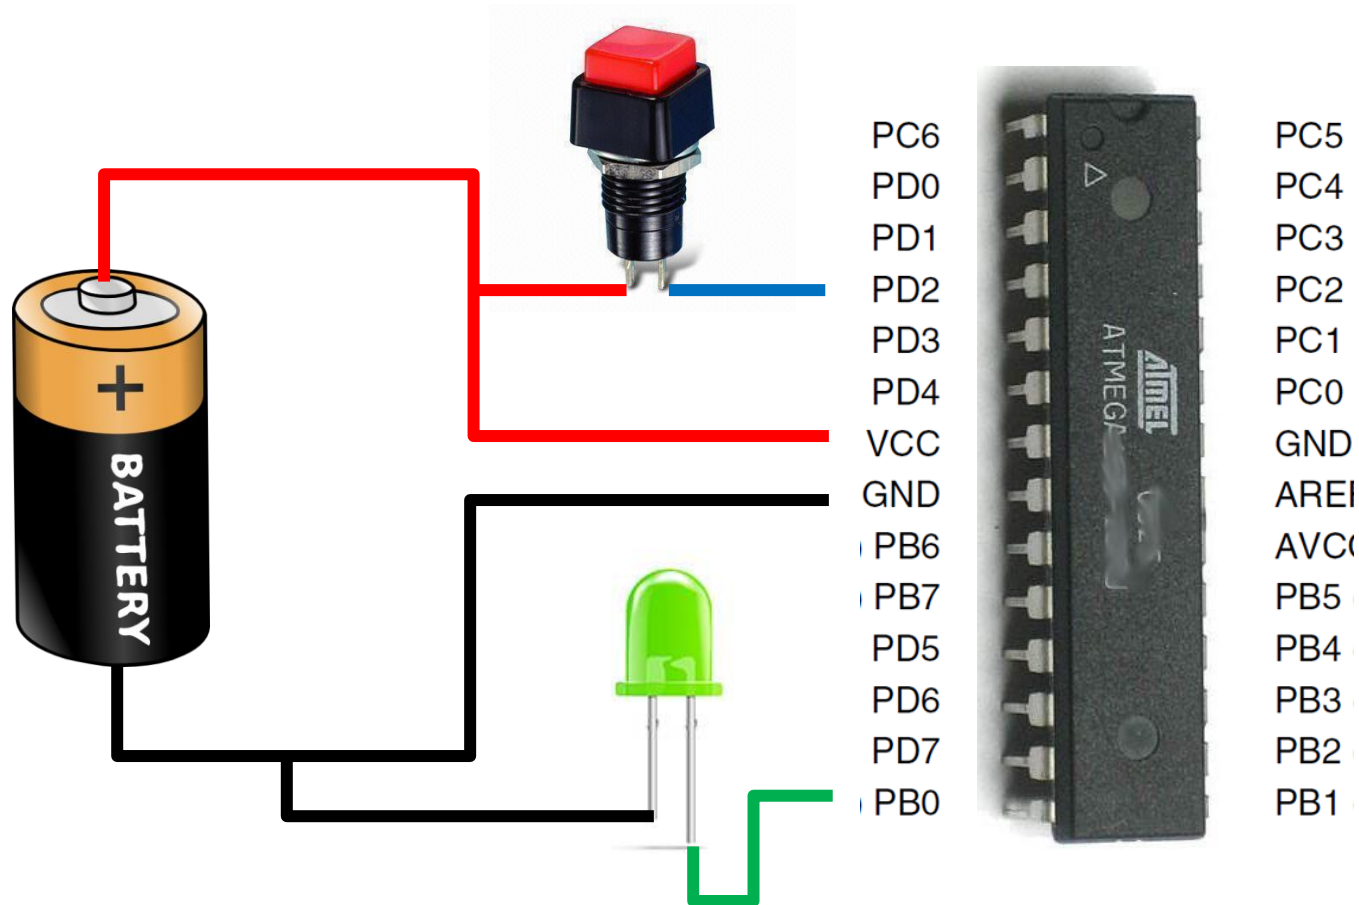

- Normal language (our language) statements to describe the program logic, i.e. the flow of the sequence of events or instructions.
- Translates our thinking to program.

	To play "One Potato, Two Potato":
●	Gather all players in a circle
	Players put both fists in the circle
	Choose a player to be the counter
	The counter begins chanting
	He repeats until one fist is left:
	[
	The counter repeats 8 times:
	[Hit one fist
●	If 1-3 or 5-7 say count + "potato"
	If count is 4 say "Four!"
	If count is 8:
	[Say "More!":
	Current fist is taken out
	Restart chant on next fist]
	If count ≠ 8 add 1 to count]
●	if there is only one fist left:
	that player is "it"
	] End

# Programming Concepts

- **Sequence** of instructions
  - Get the order correct.
- Program **flow control**
  - **Conditional structure**: do certain things based on a true or false, yes or no decision.
  - **Looping structure**: a list of instructions to do more than once.
- **Program structure** – language specific
  - The template: different sections of the source code.
- Program **syntax** – language specific
  - Instructions, symbols and statements in the source code.
- How to deal with the **data: variables, constant, data structures.**(e.g. array).

# Pseudocode: Flash LED

(Note: This circuit has been simplified. A few more components are required to form a practical circuit.)

# Pseudocodes: Flash LED

- High Level:

1. Loop:

1. If Red switch is pressed and released.

1. Flash LED

- At a lower level:

1. Loop:

1. If PD2 receives a 1 and then 0

1. Send timed string of 0 and 1 to PB0

# Reading List

- Introduction to Microcontrollers on Society of Robots.
  - [http://www.societyofrobots.com/microcontroller\\_tutorial.shtml](http://www.societyofrobots.com/microcontroller_tutorial.shtml)
- Microcontrollers and Robotics.
  - <http://home.roboticlab.eu/en/microcontrollers>

# To Do List

- For the simple circuit shown on Slide 14/38, write pseudocode at a lower level to perform the following:
  - Turn on the LED when the switch is pressed and let it turn on when the switch is released.
  - Toggle the LED on/off when the switch is pressed and released.
- Do the preparation work described in the slides in Programming Part I available on the Moodle under Practical section.
  - Download and extract the relevant files.

# Summary

- **Intelligence: think and learn.** We looked briefly on the thinking.
- Brain of a robot: **microcontroller** (MCU).
- MCU are: **IC + board**. MCU have: **IO pins**.
- We learned briefly how sensors are **connected** to input pins and actuators are connected to output pins.
- A system, e.g. robot, may have more than one MCU.
- Robot **control: deliberative, reactive, hybrid, behavior-based**.
- **Programming:** MCU + IDE + Computer.
- Start with pseudocode: translating our thinking to programming.
